Assessment Information

Red List Category & Criteria: Vulnerable B1ab(iii)+2ab(iii) [ver 3.1](#)

Year Published: 2022

Date Assessed: July 12, 2020

Justification:

Orophea erythrocarpa is a tree or shrub species endemic to southwest India. The extent of occurrence (EOO) is 10,030 km² and the area of occupancy (AOO) is 36 km². This species is only known from eight locations. It occurs in lowland forests that are threatened by habitat loss from forest plantations, agricultural expansion, dams and urbanisation. Therefore, it is assessed as Vulnerable.

Geographic Range

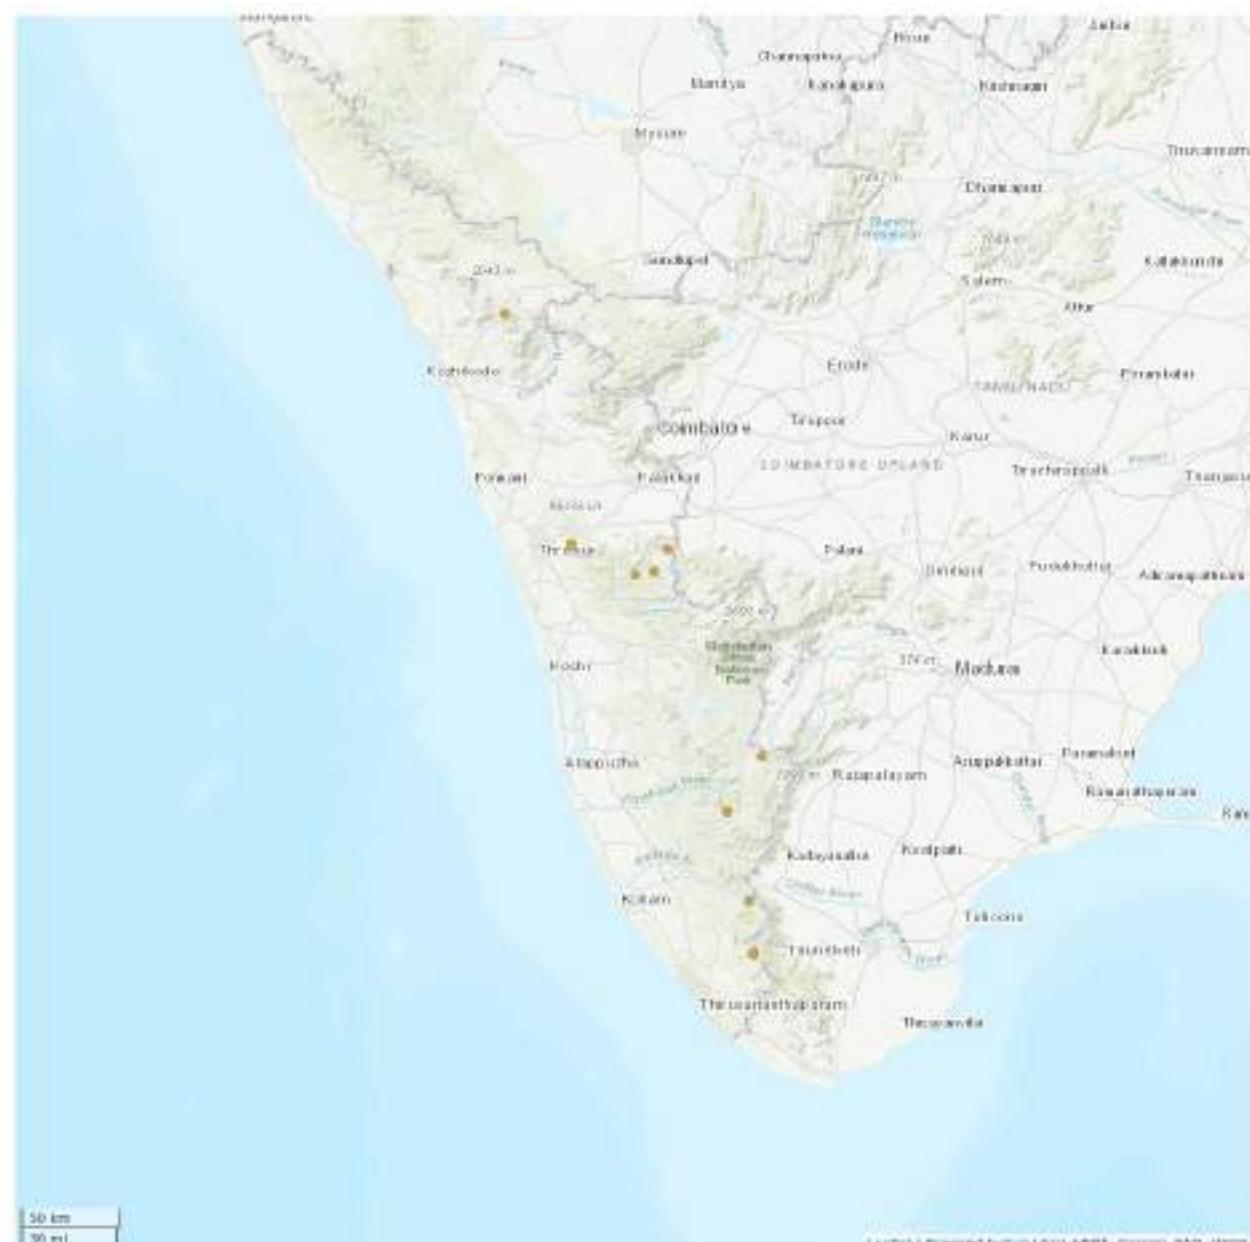

Range Description:

Orophea erythrocarpa is endemic to southwest India.

Country Occurrence:

Native, Extant (resident): India

Distribution Map

The geographical range shown and the designation used on this map do not imply any official endorsement, stance or opinion by IUCN.

Population

The population size and trend for this species are currently unknown.

Current Population Trend: Unknown

Habitat and Ecology (see Appendix for additional information)

A shrub or small tree species that occurs in evergreen forests, up to 800 m altitude.

Systems: Terrestrial

Threats (see Appendix for additional information)

Habitat loss because of forest cover loss is a possible threat for all species of *Orophea* (Hansen *et al.* 2013). This species occurs in areas that have been subject to habitat loss from forest plantations, agricultural expansion, dams and urbanisation.

Conservation Actions (see Appendix for additional information)

No specific conservation actions are currently undertaken.
